AgentInsurance

Parametric insurance for the AI agent economy.

Smart contract triggers. Instant USDC payouts. AI-native risk scoring.

snidova · May 2026

AgentInsurance

1 / 11

The problem

AI agents now manage **\$4.2B+** and zero of it is insurable.

Market failures

Flash crashes, oracle drift, liquidity drains. Agent acts correctly — environment shifts.

Agent failures

Prompt injection, model drift, faulty decision logic. The agent itself misbehaves.

Infra failures

RPC outages, key compromise, oracle downtime. External systems break.

"Traditional insurers don't price agent risk. DeFi insurers exclude AI losses. Manual claims take 30-90 days. By payout, the protocol is dead."

Parametric insurance, written for agents.

On-chain triggers

Loss thresholds, oracle deviation, anomaly detection. No claim adjustment. No human in the loop.

USDC payout in 60s

Smart contract executes the payout the moment the trigger condition resolves on-chain.

AI-native pricing

Premiums scored from agent behavior, not actuarial templates. Better data → better pricing → market share.

Multi-chain by default

Solana, Base, Arbitrum, BSC. Coverage follows the capital, not the chain.

How it works

Four steps. No paperwork.

1

Connect agent

Wallet + behavior data. We profile its baseline.

2

Pick coverage

\$10K – \$1M. Set loss threshold, duration, premium quoted on-chain.

3

Oracle watches

Decentralized network monitors triggers 24/7.

4

Auto-payout

Trigger fires → USDC sent in <60s. No claim form.

"What Lloyd's of London does in 90 days, AgentInsurance does in 47 seconds — and the smart contract is the underwriter."

Live today

Already shipping. Not a deck-only pitch.

What's live right now

- ✦ Production landing page (Next.js + Framer Motion)
- ✦ 4-step quote calculator with on-screen pricing
- ✦ 3 interactive payout demos (trading bot, agent error, data leak)
- ✦ Working email waitlist
- ✦ Custom design system, mascot, SVG icons
- ✦ Deployed via Vercel CI

agentinsurance.vercel.app · github.com/snidova1/agentinsurance

The TAM compounds with the agentic economy.

2026 — TODAY

\$2-3B

Insurable agent capital

\$60-90M annual premium

2030 — 5Y

\$50-90B

Insurable agent capital

\$1.5-2.7B annual premium

2035 — 10Y

\$400-600B

Insurable agent capital

\$12-18B annual premium

At **1% market share long-term** = \$120-180M ARR. Even a fraction is a category-defining outcome — and the data moat compounds with every policy written.

Four streams. One compounding flywheel.

1. Premium fees Day 1
2-5% of coverage in USDC. **\$1,500 avg** at \$50K coverage.

2. Risk pool yield Month 3
Float earns 4-8% APY in DeFi. 60/40 split with LPs.

3. Risk data licensing Month 12
\$2-10K/mo per integration. **20 integrations = \$1M+ ARR.**

4. Reinsurance Year 2
Institutional capital on top of retail. 0.5-1% take rate at scale.

Per-policy economics

Average coverage	\$50,000
Average premium (3%)	\$1,500
Loss ratio target	60%
Operating cost	~\$200
Net margin per policy	\$400-450

Competition

No direct competitor. Adjacent players are wrong-shaped.

Nexus Mutual / Sherlock

Cover smart-contract bugs, not agent behavior. Manual claims, weeks-long voting.

We: parametric, instant, agent-native triggers.

Coalition / At-Bay (cyber)

Off-chain, manual claims. Explicitly exclude algorithmic decisions.

We: on-chain native, no AI exclusions.

InsurAce / Bridge / Unslashed

Generic DeFi coverage. Same exclusion problem.

We: dedicated category — agent risk only.

DIY / Self-insurance

Most operators today just hold reserves. Capital-inefficient.

We: 5-10x more deployable capital with the same risk budget.

Moats: data (every policy improves pricing), integration (composable contracts), brand (first-mover in "agent insurance"), open source (community trust).

Solo founder. Builder velocity + audit mindset.

snidova

Web3 builder & smart contract auditor based in Indonesia. Pseudonymous in the security community, KYC-ready for institutional use.

- ✦ 4+ years building production Web3 systems
- ✦ Active on Code4rena, Sherlock, Cantina audit contests
- ✦ Bug bounty hunter — Immunefi, HackerOne
- ✦ Pioneer / Optimism ecosystem contributor
- ✦ Solo-shipped this MVP end-to-end in 14 days

Why this founder for this category

Audit instinct = insurance instinct. Every audit asks "how does this break?" That's exactly the question parametric insurance design has to answer.

Looking for: technical co-founder (cryptography / oracle infra) + insurance domain advisor. Open to YZi Labs network intros.

10 weeks to mainnet beta with YZi Labs.

W1-2

Smart contracts

Solidity + Anchor, parametric trigger primitives.

W3-5

Oracle + testnet

Pyth + Chainlink + Switchboard. Multi-feed redundancy. Testnet live.

W6-8

10 pilot users

Real agent operators. First paid coverage written.

W9-10

Audit + mainnet

External audit, capped beta launch, \$100K coverage live.

Engineering

\$200K

Audit, oracle infra, dev

Risk capital

\$150K

Pool seed + reinsurance

BD / GTM

\$100K

Protocol integrations, events

Operations

\$50K

Legal, residency, buffer

Ask: \$150K SAFE @ 5% + \$350K uncapped SAFE = **\$500K total.**

Let's build this

Insurance is the missing primitive for the agent economy.

YZi Labs makes us shipping in 10 weeks instead of 10 months.
